Intensity

By Hanita Lenses

Vision Redefined

About

Hanita is a global leader in innovative solutions for cataract surgery.

Intensity lens employs Dynamic Light Utilization technology for maximal light efficiency that transcends the traditional boundaries of conservative diffractive IOL patterns, bringing unprecedented vivid vision to cataract patients.
A revolution in ophthalmic optics, Intensity IOL - as its name suggests - enables intensified vision with far, intermediate and near visual acuity with no compromise at any distance from infinity to 40 cm. Intensity increases quality of life for cataract patients enabling them to perform the full range of day to day activities.
Vision Redefined

Intensity combines four core elements that together revolutionize and redefine vision for cataract patients and their surgeons.

$$\int \vec{\nabla} \times (A) = \oint$$

A new generation of presbyopia correcting IOL with maximum light intensity utilization for clear vision throughout the whole range of functional vision

Dynamic Light Utilization Technology based on Hanita Lenses proprietary algorithm

Smooth & symmetrical 5 foci distribution and 12 steps in different heights

Pupil aperture optimization

| Dynamic Light Utilization | Smooth lens profile | Optimal light distribution | Best light utilization | Continuous vision | High quality | Minimal Side effects |

Intensity technology

Minimal side effects. Maximum quality.
Continuous functional vision range.

Accurate Polish-Free Production Process

The Intensity lens is manufactured using a proprietary lathe process designed to enable maximum accuracy of both the lens profile and its diffractive rings. Through this lathe process, the lens reaches optimal sharpness and is an identical replica of the profile design for maximal contrast sensitivity.
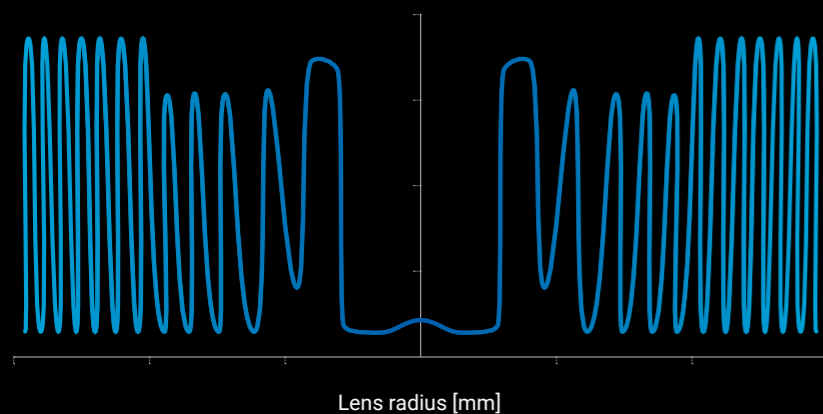

Lens Profile

The lens has a special profile that enables the creation of continuous, uninterrupted vision throughout the entire vision range. The profile is built of smooth shapes with a total of 12 steps with a central ring in 1mm diameter. Step heights vary along the lens radius with a maximum step height 3.6 microns.
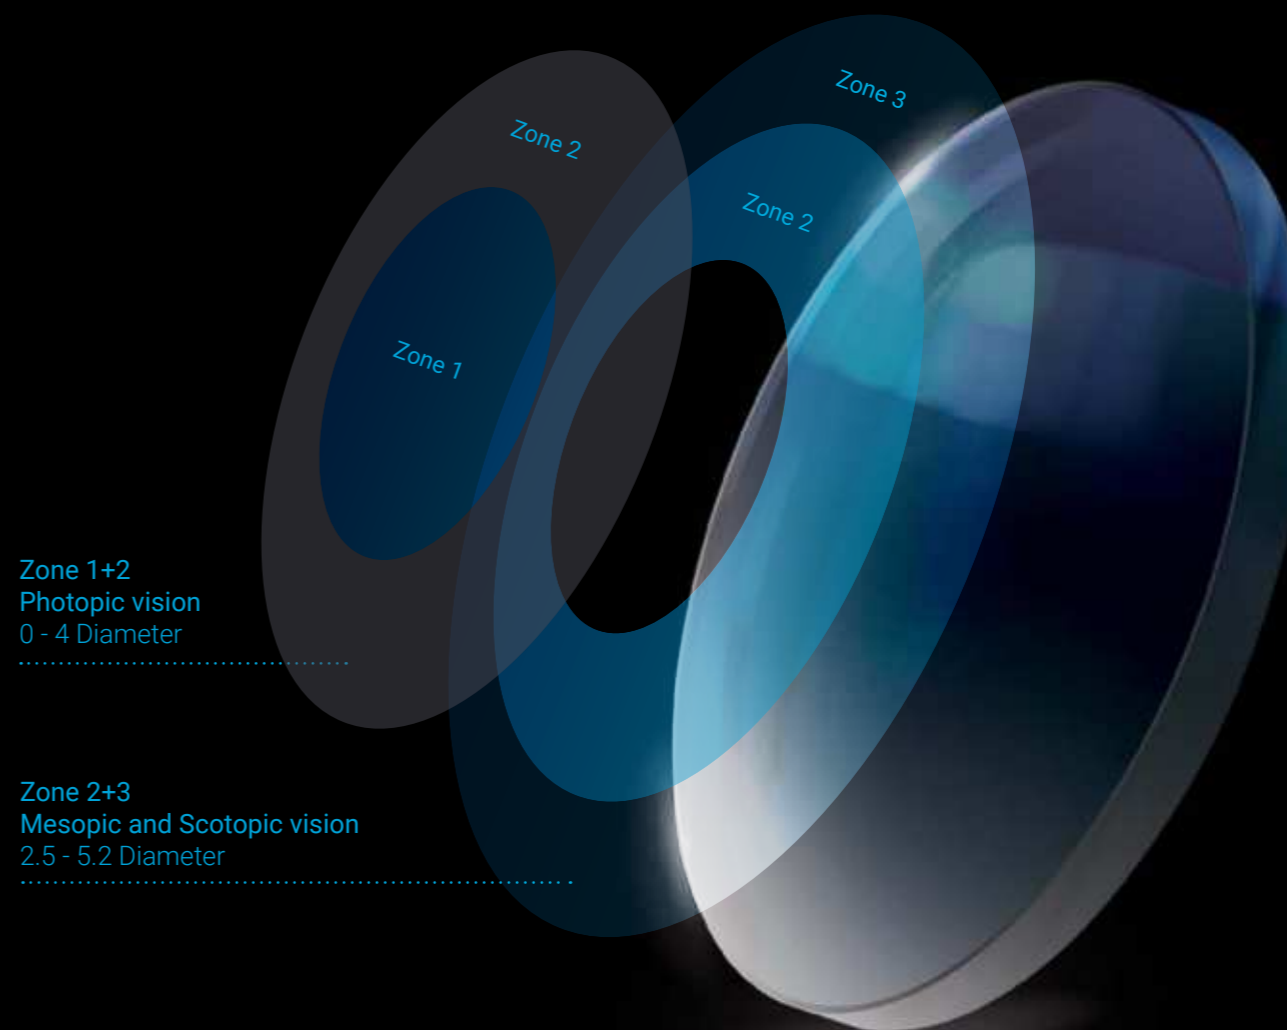

Lens radius [mm]

Sharpest Square Edge

The novel manufacturing technology enables to achieve exceptionally sharp 360° square edge, proven to be effective against PCO along with a wide-angle contact with the capsular bag.

Pupil Aperture Optimization

The lens profile consists of three zones, each of which is optimized by the Dynamic Light Utilization algorithm. Multiple areas allow for better performance, diverse pupil sizes and all lighting conditions. The special division of zones, derived from the Dynamic Light Utilization Algorithm, helps to obtain higher MTF values at far vision for large pupils.

Dynamic Light Utilization

Dynamic Light Utilization (DLU)

Intensity's proprietary iterative algorithm works on a concept of multiple loops between target plane and source plane in order to maximize light intensity utilization. It proposes phase solutions at the source plane in order to get the desired target intensity and results.
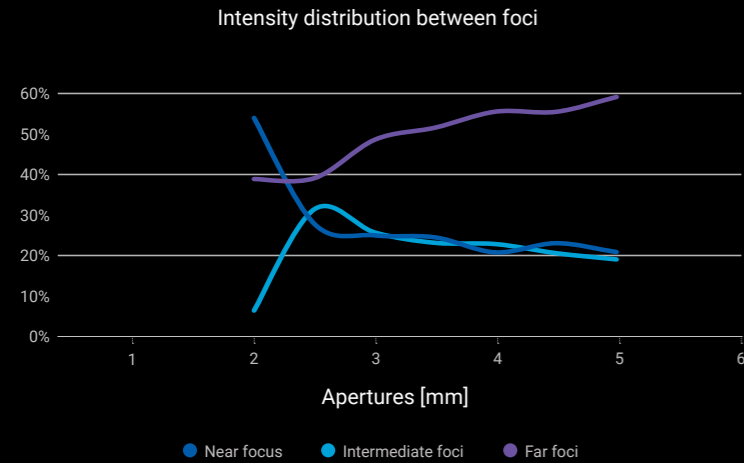

Optimal Light Distribution

Intensity is the first lens with a Symmetric foci distribution around the zero order. Based on a unique proprietary design developed using the Dynamic Light Utilization algorithm, the modulated transfer function (MTF) is increased in the area between far-intermediate and intermediate to near, enabling a continuous defocus curve.

Symetric foci distribution

	-2 Infinity	-1 133cm	0 80cm	+1 60cm	+2 40cm

Intensifier (at -1), Intensifier (at +1)

Through Focus Response [3mm aperture]

Far, Intensifier, Intermediate, Intensifier, Near

Through Focus Response

The through focus response represents MTF values in the vertical axis and the position of diopters in the horizontal axis. MTF is used to obtain information on the ability of a given IOL to transfer detail from an object to an image in a certain resolution.

* 5 foci of the lens, far intermediate and near. Intensifiers are 0.9D and +2D.

Intensity distribution between foci

Apertures [mm]

● Near focus ● Intermediate foci ● Far foci
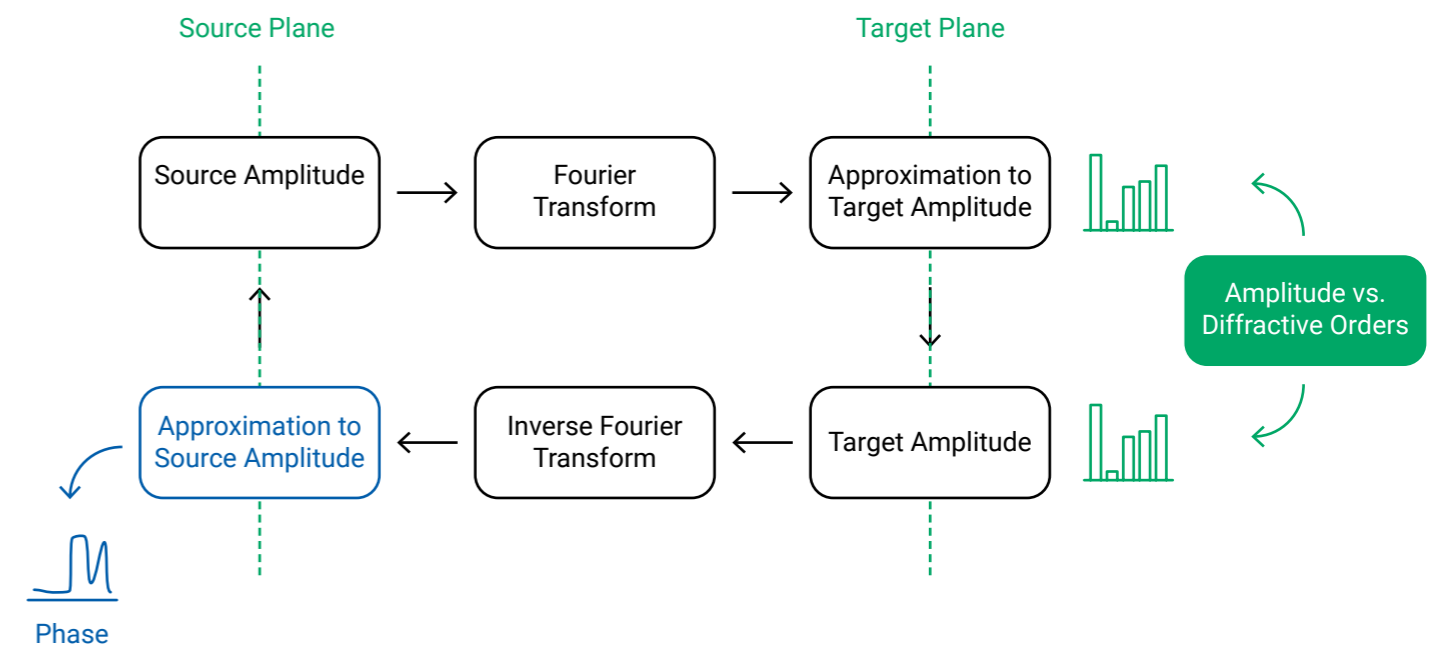

Distribution between foci

According to the light distribution in different apertures employing the Dynamic Light Utilization technology the near focus intensity does not compromise the far and Intermediate foci, the lens achieves an optimal light distribution between foci.

Maximum Light Utilization

The lens profile is highly energy efficient with 46% less energy lost in comparison to competing lenses, potentially decreasing visual disturbances and intensifying vision in patients' daily life.

Energy Utilization [%]

	FineVision	AT Lisa tri	Panoptix	Intensity
	14	14	12	6.5
	86	86	88	93.5

Dynamic Light Utilization

Source Plane → Target Plane

Source Amplitude → Fourier Transform → Approximation to Target Amplitude

Amplitude vs. Diffractive Orders

Approximation to Source Amplitude ← Inverse Fourier Transform ← Target Amplitude
